The World Egg Bank continues to expand worldwide as pioneers in egg banking because of our wonderful valued partners, verified clinics, our many egg donors and intended parents. Our recognition as the only truly centralized egg banking operation is the cornerstone of our egg quality difference. Our goal remains anchored in great working relationships, convenience, choice, transparency and superior egg quality.

Since January, The World Egg Bank has reached out and met with over 30 US IVF centers via clinic visits and remained available for information and questions at conferences worldwide. We recently returned from the Midwest Reproductive Symposium in Chicago as well as ESHRE in Vienna, Austria. We also will be attending The American Fertility Expo, UCSD In Vitro Fertilization and Embryo Transfer, StartART, Fertility Society of Australia, Canadian Fertility and Andrology Society and ASRM. Between conferences and clinic visits, our expert staff is always grateful for the opportunity to inform physicians, nurses, embryologists, and the clinical staffs about the benefits of working with our company.

We hope you enjoy our July Newsletter and we look forward to assisting your patients as they move one step closer to making their dreams of creating a family a reality.

Best Regards,

Diana Thomas, Founder/CEO
The World Egg Bank

In this edition, we will be spotlighting Anova Fertility & Reproductive Health, located in Toronto. We have been partnering with Anova since October 2018, and they do an excellent job of overseeing the monitoring of our Canadian egg donors. We would also like to share an article written by Dr. Kimball Pomeroy, our Scientific Director. In the article, he explains the importance of nitrogen storage tank safety, something that we take great pride in at The World Egg Bank.

Featured Clinic:
Anova Fertility & Reproductive Health (Anova Fertility) was founded by Dr. Marjorie E. Dixon in 2016. We strive to be the world leader in the field of reproductive medicine, not only in evidence-based medicine, but also in setting the standard for compassionate care and a positive patient experience.

We are home to the first next-generation embryology laboratory in Canada. We believe that every individual, regardless of their sexual orientation, sexual identity, gender, gender identity, family status, socioeconomic status, geography, ethnicity or religion should have the right to a family. Our mission is to achieve the best possible fertility outcome for you, by providing you with exceptional reproductive health care. We will work with you to ensure that the reproductive care you receive is personalized and focused on your needs.

There are several types of patients who seek egg donation services. Heterosexual couples may turn to egg donation because of poor outcomes on previous failed IVF cycles, or because of maternal age. Same-sex couples and single patients may also require the assistance of an egg donor, for a variety of individual medical reasons.

One of the benefits of seeking egg donor services for patients who also require Surrogacy, at Anova Fertility, is our location, Ontario, Canada. Our province provides a much easier and stress-free approach to parental recognition, with fewer barriers, for patients who need the help of a Gestational Surrogate.

Our leading, innovative and multi-disciplinary team includes physicians, nurses, laboratory technicians, ultrasound technologists, integrative health/wellness professionals and of course our exceptional administrative staff, and we are all on-site for you.

What Happens When a Tank Fails
Kimball O. Pomeroy, PhD. and Mark Marcon, MA

The recent failure of two liquid nitrogen storage tanks at two separate facilities in the United States has highlighted the need to re-examine the approach to how reproductive laboratories handle the storage of tissue. To fully understand how to increase the security and safety of stored reproductive tissue, we also need to understand why tank failure occurs.

Why Choose Us

The founder of The World Egg Bank and pioneer in the frozen donor egg industry, Diana Thomas, has broken down the critical differences every parent and clinician should know before choosing an egg bank.

Before you think that all egg banks are equal, and you focus on price comparisons, guarantees, and donor selection, first ask, how does an egg bank manage egg freezing and ultimately, egg quality? If you can’t feel assured that risks have been adequately minimized, then the least expensive cohort of donor eggs, a selection of a donor and type of guarantee offered are far less important.
